Career Mate

A voice enabled AI chatbot
for student job hunting

Problem Statement:

A student applies for a job and hears nothing back. No rejection, not even a reply. They assume that they were not good enough, the CV was weak, they applied for the wrong role maybe the interview went badly or the job was never real.

Many companies run fake ads just so they can collect ID documents and fees. All four failures look exactly the same from outside,

so the student never learns which part to fix.

Many students practice interviews by typing. A real interview is spoken and while speaking you cannot edit or delete. So typed practice trains the wrong skill.

CareerMate checks a posting before a student wastes an hour on it, tailors the CV from verified facts, runs spoken mock interviews with coaching afterwards.

Purpose :

To give the job hunt a feedback loop. The system prepares the student before applying, lets him practise interviews out loud ~~the~~ the way real interviews happen, and records the results, so that a week's application can be told apart from a job that never existed.

Users

→ Student: does everything through chatbot, builds his profile, checks posting, generates resumes and sits spoken interviews.

→ Administrator: keeps the system running, running its accuracy and handling employers.

Stakeholders

- Students
- Career Counselors
- The university
- Companies posting ghost-jobs
- Real employers
-

Five Functional Requirements

1. Job check: Scans the job ad to spot fake posts or ghost jobs and lists every red flag.
2. Verified Profile: Stores the student's real background.
3. Resume Tailoring: Rewrites resume points to match job posts.

4. Voice Interview: Asks questions, listens to answers, shows live captions and reacts to what you say.
5. Coaching Report: Gives clear feedback on answer quality, speaking speed, pauses and filler words.

Five Non-functional Requirements

1. Resume Integrity: Ensures 100% of resume points match the verified profile
2. Speech Accuracy: Keeps speech recognition word error rate under 10% using real student audio.
3. Fairness: Ensures accent groups score within 5% of overall score.
4. False flag: no more than 5% genuine jobs wrongly reported as ghost jobs.
5. Privacy: keeps students personal records private.

~~Three Risks~~

Three Risks

Risk	Effect	Solution
• False Resume Content	Fraud, Rejection	AI will only use verified profile also student will approve each change.
• False Ghost Job accusation	Lawsuits	System only gives facts.
• Voice Feature Accent bias	Discrimination, low scores	Content and delivery scored separately.

Three Quality Attributes

Integrity: IF it ^{output} cannot be proven true from your profile, the app will not write it.

Fairness: The app must understand all accents fairly so no student gets a bad score for how they talk.

Usability: The app must be super fast and simple to use.

Where AI could be used

→ spots pattern of fake ads even when every word is new.

- Puts students facts into their resumes.
- Asks questions and turns answer into text.
- Explains what was missing in the answer and how to improve it.

What could go wrong if AI is used incorrectly

- Sometimes AI makes up achievements causing student to submit false claims.
- The bot mishears words without showing captions, making a software glitch look like student's fault.
- slow hiring gets mistaken for a fake job.
- Everyone using the tool ends up with the exact same resume wording and fails to stand out.
- Full automation leaves no real person to review mistakes or fix unfair scores.
